15. Zoosanitary information

I, the undersigned official inspector, hereby certify that the aquatic animals above satisfy the following requirements.

General information

1) The Japanese authority consults with the competent authority in the exporting country in light of occurrences of the target diseases and regulatory framework for disease control in the exporting country, and notifies beforehand the competent authority in the exporting country of which status will be assigned to the country for each target disease, status 1.A, status 1.B or status 1.B'. Status 1.B' is applicable only to Non OIE listed diseases.

1.A) The country, zone, co	ompartment or estab	lishment is free of the target disease:
□Yellow head disease		$\square Necrotising\ hepatopancreatitis$
□Taura syndrome	□Infectious hypoden	rmal and haematopoietic necrosis
□Acute hepatopancrea	tic necrosis disease	\Box Infectious myonecrosis
□Tetrahedral baculovii	rosis(BP) □C	overt mortality disease of shrimp
□Gill-associated diseas	se	$\Box Spherical\ baculovirosis(MBV)$

a) The exported aquatic animal is confirmed to be from the country, zone, compartment or establishment that is confirmed to be free of the target disease under the surveillance by the competent authority in the exporting country based on the OIE code or, if relevant OIE code does not exist, by reference to the OIE code.

AND

b) In the event of an outbreak of the target disease, it shall be notified to the competent authority in the exporting country.

AND

c) The target disease is designated as the target of the official surveillance program of the exporting country in accordance with the OIE code.

1.B The country, zone, compartment or establishment is not free of the target disease:
□Yellow head disease □Necrotising hepatopancreatitis
□Taura syndrome □Infectious hypodermal and haematopoietic necrosis
□Acute hepatopancreatic necrosis disease □Infectious myonecrosis
□Tetrahedral baculovirosis(BP) □Covert mortality disease of shrimp
$\label{eq:continuous} \ \square \ Gill\ -associated\ disease \qquad \qquad \square \ Spherical\ baculovirosis (MBV)$
a) No occurrence of the target disease has been reported in aquaculture facilities or
fishing areas of the exported aquatic animal at least for one year before the export.
Mass mortality of unknown cause has not occurred and the competent authority in
the exporting country has not imposed any restriction with the intent of disease
control.
AND
b) Before exports, the exported aquatic animals (if the exported aquatic animal is
eggs or juvenile shrimp, including their broodstock) should be isolated from
aquatic animals under different health situation at least for detention periods in
the attachment at the isolation facility designated by the competent authority in
the exporting country. No clinical signs of diseases should be observed during the
isolation period.
During the isolation period, a sample of the exported aquatic animals (not
including their broodstock) should be taken based on the sampling criteria in
accordance with the OIE code (prevalence: 2%, confidence: 95%) under the
supervision of the competent authority in the exporting country. All tests must be
thoroughly conducted in the following methods and all test results should be
negative.
1.B' The country, zone, compartment or establishment is not free of the target disease:
□Tetrahedral baculovirosis(BP) □Covert mortality disease of shrimp
\Box Gill-associated disease \Box Spherical baculovirosis(MBV)
Nancy weeks like a few languages and have a few and a few allowed few allowed few and a few allowed few al
a) Mass mortality of unknown cause has not occurred at least for one year before the
export and the competent authority in the exporting country has not imposed any
restriction with the intent of disease control. AND
b) Before exports, the exported aquatic animals (or, if the exported animal is eggs or invarile shrippy including their broadsteels) should be isolated from equation
juvenile shrimp, including their broodstock) should be isolated from aquatic
animals under different health situation at least for detention periods indicated in
the attachment at the isolation facility designated by the competent authority in

the exporting country. No clinical signs of the target disease should be observed during the isolation period.

During the isolation period, a sample of the exported aquatic animals (not including their broodstock) should be taken based on the sampling criteria in accordance with the OIE code (prevalence: 5%, confidence: 95%) under the supervision of the competent authority in the exporting country. All tests must be thoroughly conducted in the following methods and all test results should be negative.

	Diseases	Samples	Diagnostic
			methods
i	Yellow head disease	The gills, lymphoid organ or	RT-PCR
		pleopod	
ii	Necrotising	DNA extracted from	Real-time PCR
	hepatopancreatitis	hepatopancreas	or PCR
iii	Taura syndrome	RNA extracted from hemolymph	RT-PCR
		or pleopod	
iv	Infectious	DNA extracted from gills,	PCR
	hypodermal and	cuticular epithelium,	
	haematopoietic	hemolymph or pleopod	
	necrosis		
V	Acute	DNA extracted from	Nested-PCR or
	hepatopancreatic	hepatopancreas	Duplex PCR
	necrosis disease		
vi	Infectious	RNA extracted from muscle or	Nested-PCR or
	myonecrosis	lymphoid organ or pleopod	Real-time
			RT-PCR
vii	Tetrahedral	DNA extracted from	PCR
	baculovirosis(BP)	hepatopancreas	
viii	Covert mortality	RNA extracted from	Nested-PCR
	disease of shrimp	hepatopancreas and midgut	or RT-PCR
		or pleopod	
ix	Spherical	DNA extracted from	PCR
	baculovirusis(MBV)	hepatopancreas and midgut	
X	Gill-associated virus	RNA extracted from the gills or	RT-nested PCR
	disease	lymphoid organ	

- 2) The thorough inspections must be conducted by the competent authority or at the facility designated by the competent authority in the exporting country.
- 3) Aquaculture facilities of the exported aquaculture animals must be equipped with basic biosecurity control in accordance with the OIE code under the supervision of the competent authority in the exporting country.
- 4) The exported aquatic animal should be inspected within 10 days prior to the export and should not demonstrate any clinical signs of infectious diseases.
- 5) The exported aquatic animal should not be given any live vaccine for the target disease.

Transport information

- 1) Materials such as containers and equipment used for transporting the exported aquatic animal should be new, or washed and disinfected properly.
- 2) Water used for transporting the animals should be free of the pathogen of the target disease or disinfected properly.
