Agriculture and the climate change agenda

From 1992 to 2007... 15 years of “very few-progress”

too complex and contradictory messages from science...

despite the main objective of the UNFCCC which state “to ensure that food production is not threatened “
2008, 2015 & 2017: 3 major turning points: Food price crisis, Paris Agreement and the Koronivia Decision
Food Security is back in the forefront of international agenda

*We must find the right direction*

*We need to connect the dots!*
We must find the right direction

We need to connect the dots!
Food Security is back in the forefront of international agenda. A holistic approach, maximizing synergies and minimizing trade-offs, for all agricultural sectors, and their correlation with food security and other human needs, would improve the effectiveness of actions undertaken to manage climate change by addressing intrinsically linked challenges as one.

We need to identify and implement the no-regret options: farmers, forest dwellers, herders and fishers are the most affected by climate change because of their limited capacity to adapt to its impacts.
Agriculture is the solution!
for climate change
